

Implement a Full fledged Pac Man game.

1. Move Pac-Man and Ghosts using gotoxy Function for a good user experience and to avoid flickering
2. Make 4 ghosts in the Game.
 - a. A ghost that can only move horizontally and if he collides with the wall he'll move in the reverse direction
 - b. A ghost that can only move vertically and if he collides with the wall he'll move in the reverse direction
 - c. A ghost that can move Randomly in the Maze.
 - d. A ghost that will follow that Pacman without sticking at any wall.
3. Pac-Man should have 3 lives. If he collides with the ghost for the first time he will lose a life but the game will not be finished. Change the location of the Pac-Man at the initial location and then the game resumes. This can happen three times until all the lives are lost.
4. Implement the logic of the Power Energizers for 30 iterations of the main function loop. Until that time Pac-Man can eat ghosts and only change the location of the ghost in that case.
5. Make a proper scoring system in the Pac-Man game.
6. Load and Store the maze from the file.
